

VIDEOGO — UX.3 Frozen Experience, in the VIDEOGO design system

Single-document handoff: the architectural design principles, the complete locked experience specification with all 38 screens inline (reskinned to the VIDEOGO design system v1 — warm near-black, bone, crimson NEED / amber READY, Instrument Sans + IBM Plex Mono, radius 0), and the frontend build handoff mapping every design-system component to every frozen surface. Primary prototype account: Moretti Impianti (home services, Varese). Pharmacy appears only as the gated design-partner scenario. Layered authority: VIDEOGO_CANON_INDEX.md. Where the design system and the freeze disagree, the freeze wins.

PART 1 OF 3

Architectural design principles

VIDEOGO — Architectural Design Principles (v1)

Status: governs the visual layer of the frozen UX.3 experience, 7 September 2026. **Sources:** the VIDEOGO design system (`videogo-design`, 6 Sept 2026) applied to the UX.3 Freeze Spec v1.1 + Final Gate Corrections. **Where this document and the UX.3 freeze disagree, the freeze wins.** Where the design system and the roadmap disagree on names, the system records the reconciliation (`recommend` is an alias of NEXT; Results lives inside contextual drawers, never the nav).

This document is the “why” behind every visual decision. The exact values live in `design-kit/tokens/` and `design-kit/tokens.json`; the component contracts live in `VIDEOGO_UX3_FRONTEND_BUILD_HANDOFF.md`.

The one-sentence thesis

VIDEOGO's success condition is that the owner opens it **less** over time — so every pixel is optimised for **earned absence, never engagement**. The interface is a calm operator reporting in, not a dashboard asking to be watched.

The nine principles

01 — No alert language. No bell, no badge, no red dot, no counters, no urgency mechanics. Attention is requested only by an object that genuinely needs the owner, and the object itself carries the request.

02 — Emptiness reads as competence. A screen with nothing on it means the engine is running well. Silence is a designed, first-class state (the SilenceState pattern: dashed hairline, 48 px of air, a bone check, one calm statement) — never an apology, a mascot, or a “get started” prompt.

03 — Absence is drawn, never left blank. Unknown is not zero and not whitespace: an unobservable value renders as the 135° absence hatch with a dashed hairline, an em dash in the faintest text step, and a caption that states *why* it is not observable. Scheduled/planned future slots use the same hatch. Never 0, never N/A, never a spinner.

04 — Evidence looks different from opinion. Every measured value is set in IBM Plex Mono; everything VIDEOGO says is set in Instrument Sans. Evidence rows hang off a 1 px rule with mono keys; the observation window is part of the label (“SAVES · LAST 28 DAYS”). Owner-reported figures carry “You told me”; measured ones carry nothing.

05 — Confidence without scoring. Confidence is how *resolved* the container is, never a number: collecting = dashed hairline + faint text · early signal = solid hairline + must name the next test · learned = panel elevation + border + the claim in the largest voice, with its evidence base. A claim only ever moves up. Stages beyond “learned” change what the copy may claim, not how the container looks.

06 — Colour means “you are needed” and nothing else. The brand is achromatic (warm near-black ramp, bone text). Exactly two hues exist, both semantic: **crimson #FF0048 = VIDEOGO is blocked** (NEED chips only — never a border, fill, heading or decoration) and **amber #E9A93C = waiting on your authorization** (READY chips and primary controls only). Text on either hue is near-black. A hueless screen therefore literally means “nothing needs you.” Zero decorative colour, no gradients, no tinted panels.

07 — The owner is never made to feel behind. No progress bars on unknown durations, no checklists of chores, no setup wizards, no streaks. Process is shown as discrete, honest stages (ProcessStages: done / now / upcoming) with ETAs only when the system can stand behind them.

08 — Observable process, opaque method. The owner sees *what stage* work is in (“Understanding your business → Finding opportunities → Building the video → Checking consistency → Ready”) — never the machinery (no model names, providers, prompts, render settings, hypotheses, learning goals). Never a dashboard.

09 — Permission has a visual grammar. Granted = solid border, closed padlock, Revoke on the same line. Requested = dashed amber, open padlock. Refused/absent = borderless, faintest text, inert. The trust line appears wherever publishing or payment appears: “*VIDEOGO only publishes within permissions you grant.*”

Foundations (the decisions, with reasons)

Colour. Warm near-black ramp, hue ~65: canvas #0C0B09 → shell #12100E → panel #171512 → nav-active #1C1A16 ; hairlines #211E1A / #292520 ; emphasis border #37322B . Text ramp: #F5F2EC (statements) / #A59E92 (body) / #6F685C (mono labels) / #4B453C (faint/absence). Elevation is one ramp step plus a border — objects that need the owner sit on panel with the emphasis border; objects at rest sit on shell with a hairline. The warm hue keeps darkness hospitable rather than clinical.

Type. Two faces, three jobs. **Instrument Sans** (weights 450/500/700 only) is everything the interface or VIDEOGO says — display tracked negative, body at 13.5/1.55, VIDEOGO’s first-person voice at 16/1.6. **IBM**

Plex Mono is every label and every measured value — labels uppercase, tracked +0.12–0.16em, terse (“NEXT POLICY”, “SAVES · LAST 28 DAYS”). Numbers are never set in the sans: the mono is the typographic marker of evidence. Measure caps at 66ch.

Space. 4 px base scale (4 8 12 16 20 24 32 40 56). Nav rail 214. Page 30/34. Card 16/18; 10 between parts of one object; 12 between objects; 6–7 between evidence rows. Compact everywhere except the silence state’s 48 px vertical — the one place air is the message.

Form. Radius 0 everywhere, including the mark. No shadows — depth would imply hierarchy the evidence hasn’t earned; elevation is surface + border. Borders are always 1 px: solid = resolved, dashed = unresolved/collecting/absent, dashed amber = permission requested.

Motion. Motion reports, it never advertises: 120 ms state changes (colour only), 200 ms enters (6 px rise max), 320 ms page transitions, one ease `cubic-bezier(.2,0,0,1)`. Never animate: a NEED object, an evidence value, the silence state, or progress of unknown duration. Reduced motion → 0 ms.

Interaction feedback. Hover and press are colour steps only (ghost → shell → panel; amber → `#D69A34`; bone → white). Nothing scales, moves or glows. Focus = 1 px bone outline, 2 px offset. Disabled = 45% opacity.

Iconography. Stroke only, 1.75 px, butt caps, miter joins, 24-grid, `currentColor`; icons always accompany a label and never replace one; the whole set stays under fifteen glyphs. No fills, duotone, emoji, or unicode glyphs as icons. (The final icon set is not yet delivered; padlock and check exist as placeholders in the house stroke. Nav renders labels only.)

Imagery. Flat surfaces; the hatch is the only texture. No imagery except real product stills (16:9 thumbnails, no wash, no filters); a thumbnail without a real frame shows the absence hatch — never a fake still, never a play icon.

The object grammar

One card shell serves all four proactive object types — anatomy fixed, in this order: **label chip › title › body › media › evidence rows › actions**.

TYPE	CHIP	SURFACE	MEANING
NEED	crimson fill	panel + border (elevated)	VIDEOGO is blocked; the blocking action is the bone button
READY	amber fill	panel + border (elevated)	waits on the owner’s authorization; primary action is amber
NEXT	mono text only	shell + hairline (at rest)	recommendation; nothing is required
LEARNED	mono text only	shell + hairline (at rest)	evidence changed intent; informational

At most **one primary button per object**. A NEED is always first on the page and never animates. Publishing is the authorization — there is no separate Approve. Status words (Idea, Making, Live, Connected, Design partner) are plain mono labels, never coloured chips.

Content principles

VIDEOGO speaks in first person, present tense, sentence case, and states the consequence, not the alarm (“Thursday’s video can’t go live”). It names uncertainty out loud and carries provenance (“based on 12 videos over 8 weeks”, “you told me”). Claim copy is bound to the claim grade — collecting → “Still collecting results.” · early → “Early signs suggest...” + next test · learned → “VIDEOGO learned...” + evidence base — and is generated from the grade, never hand-written. VIDEOGO’s own statements carry the bone attribution square; the owner’s words sit in a plain bordered block — there is no transcript, no timestamps, no second avatar. Never: “optimise / boost / unlock / supercharge”, countdowns, invented urgency, apologies for silence, model names, scores, emoji.

Hard rules (override any request)

Radius 0 · no shadows · no bell/badge/red dot · crimson only on NEED chips · amber only on READY chips and primary controls · numbers always in IBM Plex Mono · unknown values drawn as absence, never 0 · four nav items, forever · one primary button per object · no emoji · no gradients · no play icons on empty thumbnails · icons never replace labels.

The frozen experience — every screen, every rule, all 38 screens inline

VIDEOGO — UX.3 FROZEN EXPERIENCE HANDOFF

Status: FROZEN + FINAL GATE CORRECTIONS APPLIED — STRUCTURAL EXPERIENCE LOCKED, 6 September 2026 · **VIDEOGO DESIGN SYSTEM v1 APPLIED (visual layer only), 7 September 2026**

Audience: any LLM / designer / engineer continuing VIDEOGO into brandbook, SYSTEM, PLAN, BUILD.

Package contents: this document (the source of truth for the experience), `videogo_ux3_prototype.html` (self-contained clickable prototype in the VIDEOGO design system, open in any browser), `screens/` (38 PNG captures of every screen and state, filenames referenced below), `VIDEOGO_UX3_DESIGN_PRINCIPLES.md` (the architectural design principles now governing the visual layer), `VIDEOGO_UX3_FRONTEND_BUILD_HANDOFF.md` (component/token mapping for engineers), and `design-kit/` (tokens, component sources and brand assets from the VIDEOGO design system v1). **Governing canon:** use `VIDEOGO_CANON_INDEX.md` for layered authority. This handoff is the source of truth for the frozen human-facing experience; it may not override Roadmap / Step-A / Step-B invariants. It incorporates the Final EXPERIENCE Gate Corrections (6 Sept 2026). If this document conflicts with higher canon, surface the conflict; do not silently reconcile.

How to use this package as an LLM: read this document top to bottom first; it contains every screen, every interaction rule, and the exact copy for load-bearing strings. Use the screenshots to resolve layout questions and the HTML source to resolve behavior questions (all logic is vanilla JS in one file; scenario templates are in the `S[]` registry). Do not invent product behavior not described here — the freeze rule is “apply, don’t redesign.”

0. Global invariants (frozen — violating any of these fails the EXPERIENCE gate)

1. **Positioning:** “Give VIDEOGO your business. It runs the social-video engine and gets smarter.” The product behaves like a senior social/creative operator, not a tool the customer operates.
2. **Primary navigation is exactly four items:** Today · Studio · Knowledge · Connections. Nothing else. Ever. No Results nav (results live in contextual drawers), no Human Capture nav (it is a flow reached from a Need), no Settings wizard surface in the MLP.
3. **No notification bell or inbox anywhere.** Outbound reach is one chosen channel (email always available; WhatsApp only where supported), used only for genuine blockers, time-sensitive consequential actions, batched Ready items, and the periodic digest.
4. **Chat/composer is available everywhere but primary nowhere.** Placeholder copy: “*Tell VIDEOGO something — e.g. ‘talk about our new boiler service’.*” It sits at the bottom of pages as a persistent secondary strip. Today is never a blank chat.
5. **The customer owns truth, identity, consent, spend and granted permissions. VIDEOGO owns marketing judgment.** Never ask the owner a strategy question (“which hook do you prefer?”); recommend, and let them veto/override/correct.

6. **Scores rank, gates decide; language follows evidence.** UI learning copy is *generated from the canonical Learning Claim stage*, never hand-written: collecting → “Still collecting results.” / early signal → “Early signs suggest...” / operational learning → “VIDEOGO learned...”. Never over-claim.
 7. **Unknown ≠ zero.** Anything unobservable says so (“Not observable — no booking link connected”), never displays 0. Owner-reported signals carry provenance (“you told me”).
 8. **Metric order is objective-relative.** A Trust video leads with saves/completion; reach is last and labeled “context, not the goal.” Reach never mechanically leads.
 9. **Prototype ICP:** primary account is **Moretti Impianti** — family-run heating, plumbing & boiler service, Varese, since 1998; owner/technician **Luca Moretti**; current offer: **€89 pre-winter boiler check (until Nov 30)**; boundary (confirmed): **never fear-based selling**; vocabulary note: say “spesa,” not “investment.” **Farmacia Vitalis** (pharmacy) appears ONLY in the gated design-partner Direct Response scenario, explicitly labeled.
 10. **Pricing is a placeholder.** “Pricing TBD (placeholder)” until commercially locked. No 14-day free trial anywhere — the acquisition mechanic is one real video, then a hard payroll.
-

1. Onboarding (screens 01a – 01e , 02)

Flow (frozen order): website → “Here’s what I understood” → working states → first video → hard payroll.

Screen 1 — Website (01a). One field (website URL), optional direct upload and Google Drive (never implied as required). Copy: “Give VIDEOGO your business / Paste your website. That’s all we need to get started.”

Screen 2 — Here’s what I understood (01b). Five cards: Your business / Who you help / What you offer / How you sound / People & assets — each with Edit. **Rule: at least one inference must be concrete enough to prove the system actually read the business** (here: the €89 pre-winter check found on the homepage). Generic-only inferences fail the gate (Barnum-effect guard).

Screen 3 — Working (01c). Honest observable states: Understanding your business → Finding an opportunity → Building your first video → Checking it. **ETA promise is split:** understanding “takes about a minute”; the video “takes longer — we’ll tell you the moment it’s ready.” Never promise the full video in minutes unless true. “You can close this page — we’ll email you when it’s ready.”

Screen 4 — First video (01d). Production route is **forced no-human** (voiceover + on-screen text + the business’s own photos). Shows: title, “Why this” (evidence-based: seasonal search spike + review themes), style, “Passed VIDEOGO’s internal review ✓”. Includes the soft forward-tease: “Future videos like this could be stronger with Luca on camera — we’ll suggest it later when it’s worth the effort. You can always skip a capture request.” **“Try a different angle” is bounded** (counter shown: “1 left”). Absolutely no fake likes, no fake performance numbers, no impossible human footage, no locked/approve-to-unlock cards.

Screen 5 — Hard payroll (01e). Appears **only after the user has watched** the QA-passed video. Headline: “Keep VIDEOGO running.” Sells continuation of a working operator, listing: proactive opportunity-finding; differentiated videos with minimal human input; user authorizes what goes live until more is granted; learns only what evidence supports. Price block: “Pricing TBD (placeholder)”. Trust line (padlock glyph in the house stroke, never an emoji): “VIDEOGO only publishes within permissions you grant.” Footnote: “No free trial.”

QA-failure state (02). If the render cannot pass quality review within bounded automatic retries: show NO output, show NO paywall. Copy: “Your first video needs a little more time. We’ll email you when it’s ready.” (a more specific ETA appears only when the system genuinely has one) plus “Nothing is needed from you. Your understanding of the business is saved.”

Onboarding 1 — website in 01a_onboarding_step1.png

Successful onboarding → real video → hard paywall

Website in, specific understanding back (the €89 pre-winter check proves it actually read the site), honest split ETAs, a real QA-passed no-human video watchable before payment, then a hard paywall that sells continuation. No trial, no fake likes, no approve-to-unlock, price is a marked placeholder.

Here's what I understood

Check and correct anything that's wrong. You can change this later.

YOUR BUSINESS	Moretti Impianti — heating & plumbing, Varese. Family-run since 1998; Luca Moretti is the certified technician.	Edit
WHO YOU HELP	Homeowners and small condos in the Varese area; older housing stock with aging boilers.	Edit
WHAT YOU OFFER	Boiler service & repair (Vaillant and Viessmann partner), heat-pump installation, and the €89 pre-winter boiler check currently promoted on your homepage.	Edit
HOW YOU SOUND	Practical, direct, no scare tactics. "We fix it right the first time."	Edit
PEOPLE & ASSETS	Luca (owner, can appear on camera later); ~40 job photos found on the site.	Edit

Back

Looks good, continue

EXPERIENCE-gate check for this scenario: every displayed claim could be true in the real system state · no marketing decision is pushed onto the owner · four-item nav intact · no bell · composer secondary. Design-system check: crimson only on NEED · amber only on READY + primary controls · numbers in mono · unknown drawn as absence · radius 0 · no shadows. Prototype navigation: pick any scenario on the left.

Onboarding 2 — "Here's what I understood" 01b_onboarding_step2.png

Successful onboarding → real video → hard paywall

Website in, specific understanding back (the €89 pre-winter check proves it actually read the site), honest split ETAs, a real QA-passed no-human video watchable before payment, then a hard paywall that sells continuation. No trial, no fake likes, no approve-to-unlock, price is a marked placeholder.

Spec §1.1-1.6 No-human onboarding route Bounded "try another" Step B D2/D3

Onboarding 3 — honest working stages (discrete, never a bar) 01c_onboarding_step3.png

Successful onboarding → real video → hard paywall

Website in, specific understanding back (the €89 pre-winter check proves it actually read the site), honest split ETAs, a real QA-passed no-human video watchable before payment, then a hard paywall that sells continuation. No trial, no fake likes, no approve-to-unlock, price is a marked placeholder.

No-human onboarding route

Bounded "try another"

Step B 02/03

Onboarding 5 — hard paywall after watching 01e_onboarding_step5.png

Onboarding QA delayed — honest deferred state

The render did not pass quality review within bounded retries. No weak output is shown, no paywall is shown; the prospect gets an honest deferral and leaves with the promise intact.

Spec §1.5 Step B 025/033 Never show failed output Paywall only after watch

QA deferred — honest deferral, no output, no paywall 02_onboarding_qa_deferred.png

2. Activation (03)

After payment, exactly three things: (1) connect Instagram and/or TikTok; (2) choose outbound contact — Email always available, WhatsApp visible only where supported (shown dimmed “coming soon” otherwise); (3) continuity message: “I’m preparing your next videos... **Nothing needed from you right now.**” Then “Go to Today.” “Maybe later” is available (no forced completion). No setup wizard, calendar setup, marketing questionnaire, or integration marketplace.

Post-pay activation — minimal, then straight to Today

Connect distribution, choose one outbound channel (email always; WhatsApp only where supported), see that work is already continuing. No wizard, no marketplace, no calendar setup.

Spec §2 Step B 04/05 One outbound channel

ALREADY HAPPENING

I'm preparing your next videos for boiler-service season. Nothing needed from you right now.

Maybe later

Go to Today

EXPERIENCE-gate check for this scenario: every displayed claim could be true in the real system state · no marketing decision is pushed onto the owner · four-item nav intact · no bell · composer secondary. Design-system check: crimson only on NEED · amber only on READY + primary controls · numbers in mono · unknown drawn as absence · radius 0 · no shadows. Prototype navigation: pick any scenario on the left.

Post-pay activation 03_activation.png

3. Today (04 – 07, 22, B1)

Today is an **attention-allocation page**: proactive objects ARE the page (1–3 visible normally), each carrying its own action. Object types (canonical vocabulary, frozen): **NEED** (blocking; VIDEOGO cannot proceed) · **READY** (consequential item awaiting authorization) · **NEXT** (strategic recommendation) · **LEARNED** (evidence changed intent; informational). **“Upcoming” is schedule only and never means recommendation**. At most ONE non-blocking ask per visit; a blocking NEED may override.

- **NEED example (04)**: “Instagram connection expired — publishing is paused” with embedded [Fix connection]; shows downstream consequence (“Thursday’s video can’t go live”).
- **NEXT example (05)**: recommendation with **Why this** (evidence: most-repeated question in reviews/DMs) and **Expected** (honest, including uncertainty: “direct booking impact is uncertain”). Actions: Good — make it / Later / Dismiss.
- **Silence state (06)**: the SilenceState pattern — dashed hairline, 48px of air, bone check in the house stroke: “Everything is moving. Nothing needed from you.” plus a one-line status (in production / scheduled / collecting). Silence is a valid, designed state.

- **First-Dismiss teaching (07 , 07b)**: shown ONCE, on the first strategic dismissal only: “**Dismiss** means ‘don’t do this.’ **Later** means ‘not now.’” Never repeated. (Reason: Dismiss writes strategic evidence, Later writes timing evidence; mislabeling poisons learning.)
- **Quiet-week digest (22)**: compact three rows — **Done** (what shipped, what was decided, “0 things needed from you”) / **Actual** (best outcome with provenance; explicitly states when business impact is not observable and why) / **Next** (intent). This digest is the value story under earned silence.
- **Default day (B1)**: typically one READY object + Upcoming strip; READY’s button deep-links to review/publish.

Today — blocking NEED (crimson chip, bone blocking button) 04_today_need.png

Today — a NEXT recommendation, not a task

VIDEOGO surfaces one strategic recommendation with its reasoning. The owner can accept, defer (Later), or dismiss (strategic evidence). Nothing is required. NEXT sits at rest — no fill, no elevation.

Quiet-week digest — Done / Actual / Next 22_quiet_week_digest.png

Today — browsable default day B1_page_today.png

4. Studio (08 – 16 , B2 , B2b , B2c)

Pipeline: Ideas → Making → Ready → Live. Context panel on the right toggles **Feed | Calendar** (B2 , B2c): feed shows the honest Instagram-grid preview with scheduled slots dimmed (no fake engagement); calendar shows scheduled posts only. Clicking any card replaces the panel with its **drawer** (B2b).

- **Ideas = veto window (08), not an approval queue.** Production proceeds unless the owner intervenes. Card drawer exposes ONLY: What we’re saying / Format / Why this / Status. It never exposes: Hypothesis, References, Learning goal, evidence graphs, providers/models. Actions: Not now / Reject / Change something (free text). No “+ New concept” button; owner-originated requests enter through the composer and pass through the same reasoning pipeline. Status line sets the veto norm: “Starts production tomorrow unless you say otherwise.”
- **Making (09):** credible stages (Writing & assembling → Producing → Quality review) + honest ETA (“usually ready by 15:00 today”). No percentages theater, no provider names.
- **Ready (10):** actions are exactly **Publish / Schedule / Change something / Reject** — no standalone Approve; publishing IS the authorization. The Publish sheet (10b) opens **pre-filled**: recommended

platform(s), caption, recommended time — all inline-editable. Trust line (padlock glyph in the house stroke, never an emoji): “VIDEOGO only publishes within permissions you grant.” **No auto-publish ask on first publish.**

- **Change something (11):** natural-language edit intent; VIDEOGO classifies underneath. Behaviors shown: a quality fix is applied and generalized (“I’ll keep intros tighter on comparison videos”); a vocabulary correction becomes durable state (“‘spesa’, not ‘investment’ — will apply to every future video”).
- **Reject (12 , 12b):** one tap of reason chips — **Not true / Not us / Not good enough / Not now / Other.** “Not us” response offers (does not force) promotion to a permanent boundary via Knowledge.
- **Earned auto-publish proposal (13):** later-state only, based on demonstrated behavior (“last 6 educational videos performed as predicted and were published without strategic changes”), scoped to ONE content type; exceptions always come back for confirmation. Actions: **Allow for this type / Not now.** Withdrawal always possible — the stable revoke surface is Account / Settings (§8A). Trust line: “VIDEOGO only publishes within permissions you grant.” No global autonomous mode.
- **Live drawers (14 / 15 / 16):** three evidence states of the same layout. Collecting: dash tiles + “Still collecting results.” Early signal: “**Early signs suggest** checklist-style boiler videos hold attention longer than your average. I’ll test one more before changing the plan.” (names the next test). Operational learning: “**VIDEOGO learned:** videos answering real customer questions get saved about 3× more than promotional ones — based on 12 videos over 8 weeks.” + Next policy + saturation note (“this angle is starting to repeat, so I’m also trying one fresh structure”). “**Make another like this**” is user intent, not a strategy button — the one bounded pushback: “I can do that — though this angle is starting to repeat. I’d try a customer-story video next.”

Studio Ideas — a veto window, not an approval queue

VIDEOGO decides what's worth making; the owner can veto, defer or redirect — but production does not wait for approval. The drawer exposes only what's useful: no Hypothesis, no References, no Learning goal, no "+ New concept", no Approve.

Spec 94 Ideas + drawer Step B D1 Simple surface, sophisticated substrate

IDEA

Why we show the price before we start the job

SAYING

Transparent pricing isn't a marketing line — it's how Moretti has worked since 1998. Written quote before any work starts.

FORMAT

Luca voiceover over real job photos · ~35 sec

WHY THIS

Call-out pricing is the #1 objection in your category locally; your flat-fee policy is unused proof.

STATUS

Starts production tomorrow unless you say otherwise

Not now

Reject

Change something — tell VIDEOGO...

EXPERIENCE-gate check for this scenario: every displayed claim could be true in the real system state · no marketing decision is pushed onto the owner · four-item nav intact · no bell · composer secondary. Design-system check: crimson only on NEED · amber only on READY + primary controls · numbers in mono · unknown drawn as absence · radius 0 · no shadows. Prototype navigation: pick any scenario on the left.

Ideas — veto window + drawer 08_studio_idea_veto.png

Making — credible progress, no machinery

Progress the system can actually stand behind: discrete production stages plus an honest ETA — never a percentage bar on an unknown duration. No provider names, no render settings.

Spec 94 Making

Observable process, opaque method

Making — discrete stages, honest ETA 09_studio_making.png

Ready → Publish — approval lives inside the action

No standalone Approve. Publishing or scheduling IS the authorization. The sheet arrives pre-filled — platform, caption, recommended time — every field overridable inline. No auto-publish ask on first publish. READY is the amber chip: it waits on the owner's time.

Heat pump vs new boiler: the honest math

The intro is too slow — get to the numbers faster.

■ Done — trimmed the opening to 2.5 seconds, numbers now appear at 0:04. I'll keep intros tighter on comparison videos going forward.

And don't say “investment”, we say “spesa” with customers.

■ Changed. I've noted “spesa, not investment” as part of how Moretti talks — it will apply to every future video.

Anything else to change... Send

Drawer shows only what's useful: no hypothesis, references or learning goals — that machinery stays internal.

EXPERIENCE-gate check for this scenario: every displayed claim could be true in the real system state · no marketing decision is pushed onto the owner · four-item nav intact · no bell · composer secondary. Design-system check: crimson only on NEED · amber only on READY + primary controls · numbers in mono · unknown drawn as absence · radius 0 · no shadows. Prototype navigation: pick any scenario on the left.

Studio — card drawer open B2b_studio_drawer_open.png

Studio — Calendar context B2c_studio_calendar.png

5. Knowledge (17, 18, B3)

Two panes: chat (left) mutates the knowledge cards (right) **visibly** — every correction is confirmed in words and reflected on the card ("✓ updated just now"), including downstream consequences ("two upcoming ideas mentioned installs — I've reworked both"). Cards: About / Customers / What we sell / How we sound / People & assets / What we talk about, each with Update.

- **Routine correction (17):** no ceremony, immediate visible mutation.
- **Consequential Protected Identity change (18):** exactly one explicit confirmation dialog — "Make this a permanent boundary? 'Moretti Impianti never uses fear-based selling.' VIDEOGO will refuse this angle in every future video — even if it performs well elsewhere. Only you can change this later." **Confirm / Cancel**. Performance can never mutate identity; only the owner can.
- **People & assets (B3):** minimal, not a DAM. Per-person state (on camera ✓ / consent pending) and a "Manage use" affordance (what footage exists, permitted uses, withdraw anytime). A new person's consent is requested from that person at their first capture, never assumed from the owner.

Knowledge — a routine factual correction, visibly confirmed

Ordinary corrections mutate state with visible confirmation and no ceremony. No explicit-confirm dialog — that's reserved for consequential identity changes (next scenario).

Spec §5

Corrections visibly confirmed

Protected identity — one explicit confirmation 18_identity_confirmation.png

Knowledge — browsable page B3_page_knowledge.png

6. Connections (19 , B4)

A short supported list, nothing else: **Instagram** (publishing + results), **TikTok**, **Google Drive** (named folder, read-only), **Direct upload**. Each row: what it's for, status, connect/disconnect. Footer: “🔒 VIDEOGO only accesses what you connect... Disconnect anything, anytime.” No marketplace, no search, no available-integrations rail. **Meta Ads exists only as a gated design-partner state and is invisible to standard accounts.**

Connections — a short supported list, not a marketplace

Four visible connections drawn in the permission grammar: granted = solid border + closed padlock, absent = plain. No search, no catalog, no ten-source grid, no Results nav. Ads exists only as a gated design-partner state and is invisible here.

Spec §6 Step B 015 Connectors-first, never connector-dependent

Connections — scenario state 19_connections_minimal.png

Connections — permission grammar page B4_page_connections.png

7. Human Capture (20)

Never a section; a **contextual NEED** creates it: “15 minutes of Luca on camera would make November’s trust videos stronger” — with why (evidence), what (batched: 2 talking clips + 3 workshop shots), effort (phone, natural light, no memorizing), and **“Not this month”** as a first-class answer. Requests are batched monthly; capture is asked for only when real presence materially improves the work, and preferably only after live value exists.

Mobile flow — three screens (frozen): 1. **Session setup + consent:** what you’ll need (15 min / quiet / natural light / phone stand), what this session creates, and contextual consent: “VIDEOGO may use footage from this session to create videos for Moretti Impianti.” **Synthetic voice/avatar always needs separate permission and is not part of the MLP.** 2. **AI camera coach:** one clip at a time; guides framing, position, lighting, the spoken prompt (“say it in your own words...”), retakes. One copied link = one setup-compatible session. 3. **Complete:** clip checklist, where footage goes (asset library), what happens next (videos appear in Studio as usual).

Explicit banner: “Design-partner mode · Farmacia Vitalis (pharmacy) — this surface never appears for a standard account.” One narrow pattern only: keyword comment (“ALLERGIE”) → approved DM (editable)

text) → link/booking. Actions: **Allow / Not now / Edit message**. Invariants stated in-UI: comments, DM deliveries and bookings tracked as separate steps; a comment is never counted as a sale; unobservable DM delivery is recorded as unknown, not zero. No automation builder, no branching workflows.

Farmacia Vitalis — gated Direct Response 23_pharmacy_direct_response_gated.png

8A. Account / Settings — secondary utility surface (final gate correction)

Opened from the **account control at the bottom-left** of every screen (ACC screenshot). It is NOT primary navigation and NOT a setup wizard; the four-item nav is unchanged. Contents (frozen minimum): **Account** — business/account name, owner, preferred outbound channel (Email; WhatsApp only where supported). **Billing** — current plan / pricing state (placeholder until locked), manage subscription, cancel. **Permissions** — every granted scoped Action Right listed with explicit **Revoke** (e.g. “Organic educational auto-publish — Allowed → Revoke”; “Promotional auto-publish — Not allowed”; “DM response path — Not allowed”; “Paid spend — Not allowed”); VIDEOGO may propose expansion, only the customer grants; **no global**

autonomous-mode toggle. Your data — export data, delete account (deletion note: media/identity/account state removed; de-identified aggregate learnings retained only where contractually allowed). Boundaries: connections stay in Connections; person/likeness consent stays contextual in Knowledge → People & assets → Manage use; **no notification-preference matrix**.

Account / Settings — secondary utility ACC_account_settings.png

8B. Week-one empty states — frozen in EXPERIENCE (final gate correction)

A paid account whose pipeline is not yet populated never sees a dead blank screen — and never sees templates, “create content” buttons or setup tasks (E1 screenshot). Studio: **“VIDEOGO is preparing your first batch.** I’m finding the strongest opportunities and building the first executions. Nothing is needed from you right now.” (If a genuine blocker exists, the relevant NEED shows instead.) Live/Results before first

publication: “**Nothing live yet.** I’ll start showing results and learnings here after your first video is published.”
Unknown is not zero. SYSTEM determines only the technical state driving these screens.

Week-one empty states E1_week_one_empty_states.png

9. Screenshot index

01a – 01e onboarding steps 1–5 · 02 QA deferred · 03 activation · 04 Today NEED · 05 Today NEXT · 06 silence · 07 / 07b first-Dismiss teaching · 08 Idea veto + drawer · 09 Making · 10 / 10b Ready + publish sheet · 11 change-something · 12 / 12b reject chips · 13 auto-publish proposal · 14 live collecting · 15 early signal · 16 operational learning · 17 Knowledge routine · 18 identity confirmation · 19 Connections scenario · 20 Human Capture (Need + 3 phones) · 21 unknown/not-observable · 22 digest · 23 pharmacy DR gated · B1 – B4 browsable default pages (Today, Studio + B2b drawer + B2c calendar, Knowledge, Connections) · ACC Account/Settings utility · E1 week-one empty states.

10. Explicit non-products (do not add, ever, without reopening Step B)

Traditional video editor / timeline · template marketplace · analytics dashboard · KPI configuration · notification center or bell · prompt/model/provider selectors · broad connector marketplace · agency command center · automation builder · experimentation UI for SMBs · Ads Manager clone · public confidence scores · ontology manager · fake social proof of any kind · approve-to-unlock mechanics · global “autonomous mode.”

11. Known post-freeze work (not part of this handoff)

~~Visual brandbook and final identity~~ — **done: the VIDEOGO design system v1 (warm near-black, bone, crimson NEED / amber READY, Instrument Sans + IBM Plex Mono, radius 0) is applied as of vD.1** · mobile layouts for the owner web app (only Capture is mobile here) · Italian production copy (all strings here are English placeholder voice) · internal operator/escalation console (Decision 33; never customer-facing) · week-one empty-state behavior is frozen in EXPERIENCE (§8B); SYSTEM determines the technical state that drives it · pricing.

Freeze rule for whoever picks this up: you may refine visual design, layout polish, and copy voice. You may not change flows, object types, action sets, gating, language-evidence binding, consent granularity, or any invariant in §0 without a Step B change process.

12. Change log

vD.1 — 7 Sept 2026, Design system applied (visual layer only). The prototype and all 38 screens were rebuilt in the VIDEOGO design system v1 (`videogo-design`): warm near-black surface ramp (#0C0B09 → #37322B), bone text #F5F2EC, exactly two hues — crimson #FF0048 on NEED chips only, amber #E9A93C on READY chips and primary controls only — Instrument Sans + IBM Plex Mono (every label and every measured value in mono), radius 0, no shadows, unknowns drawn as the 135° absence hatch, dashed = unresolved, learning grades expressed by container resolution (collecting = dashed / early = hairline / learned = panel + border). NEED’s blocking action is the bone button; publishing stays amber. All emoji and glyph-icons removed per system rule (padlock/check in the 1.75px house stroke). **No flow, object type, action set, gating rule, load-bearing string, nav item or §0 invariant changed.** Where the design system and this freeze disagree, the freeze wins (per the design-system readme); no such conflict required resolution beyond the roadmap-era naming notes already recorded in the system (`recommend` = alias of NEXT; Results lives inside contextual drawers, not the nav).

vC.1 — 6 Sept 2026, Final EXPERIENCE Gate correction pass (bounded). Added Account / Settings secondary utility (§8A) reachable from the account control — the stable surface for revoking Action Rights, billing and data controls (Gate 3/5 fix). Froze week-one empty states in EXPERIENCE (§8B). Four copy corrections: paywall/publish/auto-publish trust line → “VIDEOGO only publishes within permissions you grant” (protects the permission ladder); activation → “preparing your next videos” (cadence is not a product invariant); QA-deferred ETA removed unless credible; Human Capture tease → “when it’s worth the effort / you can always skip a capture request.” Canon line now defers to `VIDEOGO_CANON_INDEX.md`. Nothing else

changed: flows, object types, action sets, gating, evidence-language binding, nav, ICP invariants all as frozen. **STRUCTURAL EXPERIENCE = LOCKED.**

VIDEOGO — Frontend Build Handoff (UX.3 frozen experience × design system v1)

Audience: the engineer/LLM building the production front end. **Authority order:**

VIDEOGO_UX3_FREEZE_HANDOFF.md (behavior, flows, load-bearing copy — frozen) →

VIDEOGO_UX3_DESIGN_PRINCIPLES.md (visual rules) → this document (implementation mapping) → design-kit/ (tokens + component sources, verbatim from the design system). If anything here conflicts with the freeze handoff, the freeze wins.

1. Stack & setup

- Any React setup works; the component sources in `design-kit/components/` are dependency-free React function components with inline styles reading CSS custom properties, plus `.d.ts` types and a `.prompt.md` usage note each. Port them to your styling system if you prefer — the tokens are the contract, not the inline styles.
- Load `design-kit/styles.css` once (it imports `tokens/*.css`: fonts, colors, typography, spacing, form, motion, base). All values are exposed as `--vg-*` custom properties; the machine-readable copy is `design-kit/tokens.json`.
- Fonts: Instrument Sans (400–700 variable; use 450/500/700 only) and IBM Plex Mono (400/500/600), both SIL OFL 1.1, currently served from Google Fonts (`tokens/fonts.css`); self-host binaries before production hardening.
- Brand assets: `design-kit/assets/` — `videogo-mark.svg` / `-inverse`, `videogo-lockup.svg` / `-inverse`. The mark is the E-chevron glyph alone, squared terminals, set at 1.4× the wordmark cap height. Lockup SVGs carry live text — convert to outlines (with Instrument Sans installed) before trademark use.
- Global CSS ground rules: `*{box-sizing:border-box;border-radius:0}`, `body` = canvas bg + `--vg-body` in text-2, `:focus-visible` = 1px bone outline offset 2px, `::selection` = border bg / text-1. `@media (prefers-reduced-motion: reduce)` zeroes all durations.
- The reference implementation of every screen is `videogo_ux3_prototype.html` (vanilla JS, one file, scenario registry `S[]`) — resolve layout questions with `screens/*.png`, behavior questions with the prototype source.

2. Component inventory → surface map

All sources in `design-kit/components/`. “Freeze surfaces” reference the freeze handoff sections and screenshot ids.

COMPONENT	CONTRACT (ESSENTIALS)	FREEZE SURFACES
controls/Nav	Exactly four items: Today · Studio · Knowledge · Connections (NAV_ITEMS, never extended). 214px side rail with Wordmark on top and AccountControl at the foot; orientation="bottom" for the mobile bar (44px targets). Active = --vg-nav-active + text-1 + 500; never amber. Labels only until the icon set is delivered.	every screen; §0.2
controls/AccountControl	Initials in mono inside a bordered 34px square + business name + sector. Opens Account/Settings (secondary utility, §8A) — the only route to it.	every screen; ACC
brand/Wordmark (+ Mark, MarkGlyph)	Achromatic lockup; mark = cap height px; markOnly for avatar/app icon.	nav rail; auth/marketing surfaces
objects/ObjectCard	The one shell for NEED / READY / NEXT / LEARNED (type="recommend" aliases next). Anatomy fixed: chip > title > body > media > evidence > actions. need/ready = panel+border; next/learned = shell+hairline. Never animates when type="need". Max one primary button in actions.	Today objects (04, 05, 13, 20), Ready (10), week-one (E1)
controls/LabelChip	kind: need = crimson fill · ready = amber fill · everything else = mono text-3, no fill (use for IDEA / MAKING / LIVE / CONNECTED / DESIGN PARTNER...). Never carries any other meaning.	all objects, Studio columns, status rows
controls/Button	Three variants only: blocking (bone fill — only inside a NEED), primary (amber — one per object; Publish, Send, Confirm, Allow, Good — make it), ghost (border #37322B — everything else: Schedule, Change something, Reject, Later, Not now, Attach...). 34px desktop / 44px touch. Hover/press = colour steps only.	everywhere
controls/Composer	Persistent secondary strip at a section's bottom: ghost Attach + field + one primary Send. Never the page; never a transcript. Placeholder is the frozen string: "Tell VIDEOGO something — e.g. 'talk about our new boiler service'".	§0.4; all main pages

COMPONENT	CONTRACT (ESSENTIALS)	FREEZE SURFACES
content/EvidenceRow	Mono key (88px column, +0.12em caps) + sans value, hung on a 1px left rule. <code>rows=[{k,v}]</code> . Never a table, icon or chart.	Why this / Expected / Format / Status blocks (01d , 05 , 08 , 10 , 22 , drawers)
content/MetricTile	Mono 28px value; observation window inside the label ("SAVES · LAST 28 DAYS"); <code>delta</code> in words against the account's own baseline, never a chart; <code>provenance="You told me"</code> for owner-reported.	Live drawers (14 – 16 , 21)
content/AbsenceTile	Unknown ≠ 0: hatch bg, dashed border, em dash in text-4, caption stating why ("Not observable — no booking link connected"). Never a spinner. Never animates.	14 (collecting), 21 (bookings), E1
states/ConfidenceClaim	<code>grade</code> : collecting = dashed + text-3 body · early = hairline + 14px text-2 + <code>nextTest</code> required · learned = panel + border + 18px text-1 claim + evidence children. Copy is generated from the claim grade (freeze §0.6). A claim only moves up.	14 – 16 , 21 , digest claims
states/SilenceState	Dashed hairline, 48px vertical, bone check, statement 17/450 + status line. Zero hue, zero animation, no illustration/CTA.	06 , E1 (statement variant)
content/ProcessStages	Discrete stages, never a bar: done = bone check · current = bone square + optional note · upcoming = outlined square. The only place a stage advancing may animate (200ms colour). Public stage vocabulary only — no machinery.	onboarding working (01c), QA deferred (02), Making (09)
content/Thumbnail	16:9, 168×96 at object scale; duration chip mono 9.5/600 on 86% canvas, bottom-right, 5px inset. No <code>src</code> → absence hatch; never a spinner or play icon.	Ready cards, Studio cards, capture coach
content/FeedPreview	3-col 9:16 grid; published/ready slots real, scheduled/planned slots dimmed hatch; state word in micro mono. Never fake counts, no platform chrome.	Studio Feed context (B2), onboarding payoff
content/Attribution	Bone 22px square + first-person statement in the voice register. No timestamp, no name, no bubble, no second speaker. Owner messages:	Change something (11), Knowledge chat (17 , 18 , B3)

COMPONENT	CONTRACT (ESSENTIALS)	FREEZE SURFACES
	plain bordered block, right-aligned (see prototype <code>.msg.me</code>).	
<code>content/PermissionLockup (+ TRUST_LINE)</code>	granted = solid border, closed padlock, Revoke inline · requested = dashed amber, open padlock, Allow · refused = borderless text-4, inert. Status words: ALLOWED / ASKING / NOT ALLOWED. <code>TRUST_LINE</code> = “VIDEOGO only publishes within permissions you grant.” — render wherever publishing or payment appears (paywall, publish sheet, auto-publish, Account).	Connections (<code>B4</code>), Account permissions (<code>ACC</code>), trust lines

3. Screen recipes (composition per page)

- **Today** (`B1` , `04` – `07`): header (mono kicker + display-2 “Today” + date in micro mono, right) → 0–3 ObjectCards (NEED always first) → Upcoming strip (schedule rows: mono time · sans title · mono status — never a recommendation) → Composer. Silence day = SilenceState instead of objects.
- **Studio** (`B2`): four columns with mono headers IDEAS · VETO WINDOW / MAKING / READY / LIVE; cards open a right drawer (EvidenceRow + actions; selected card border steps to bone); context panel toggles Feed (FeedPreview) | Calendar (mono grid; filled square = published/locked, outlined = planned). No “+ New concept”, no Approve, no Ads toggle.
- **Knowledge** (`B3` , `17` , `18`): chat column (Attribution pattern) mutates fact cards on the right (mono card labels, check + “UPDATED JUST NOW” on mutation). Consequential identity boundary = one modal (panel + border) with Confirm / Cancel.
- **Connections** (`B4` , `19`): PermissionLockup list — four supported connections, nothing else. Trust line at the foot (access variant).
- **Publish sheet** (`10b`): right sheet on scrim `rgba(12,11,9,.65)`, shell + left border; pre-filled platform chips (selected = bone border), caption textarea, when fields, amber Confirm & schedule, trust line.
- **Account / Settings** (`ACC`): reached only from AccountControl. Account / Billing / Permissions (PermissionLockup rows with Revoke) / Your data. No notification matrix, no global autonomous mode.
- **Human Capture mobile** (`20`): three phone screens (setup+consent / coach / complete); consent copy is frozen; synthetic voice/avatar always a separate permission.
- **Week one** (`E1`): SilenceState-style “VIDEOGO is preparing your first batch.” + hatch “Nothing live yet.” card. Never templates or create buttons.

4. Interaction & state rules

- Hover/press/focus/disabled exactly as tokens (`--vg-dur-state` colour-only; focus bone outline; disabled 45%).
- Enter animations: 200ms, ≤6px rise — but never on a NEED, an evidence value, the silence state, or unknown-duration progress. Page transitions 320ms.

- Reject flow: five chips (Not true / Not us / Not good enough / Not now / Other), one tap; selected chip steps to bone; response is VIDEOGO speaking (Attribution).
- First-Dismiss teaching: render once ever (persist a flag), inline within the object.
- Toasts: panel bg + border, text-1, bottom-center of the app pane, ~2.4s; confirmation language only, no emoji, no exclamation marks.
- All numerals user-visible = mono. All labels = mono uppercase tracked. Everything VIDEOGO says = sans, first person, sentence case.

5. Accessibility & quality bar

Contrast: text-1 17.4:1, text-2 8.5:1 on canvas; mono labels (text-3, 3.9:1) are $\geq$ large-text equivalent — never use text-3 for body copy; text on crimson/amber is near-black. Touch targets 44px on mobile (touch props). Focus visible on every interactive element. prefers-reduced-motion honored globally. Chips/status words are real text, not colour alone (colour never carries meaning without the mono word next to it). Thumbnails: alt from the video title; absence tiles: aria-label="not observable".

6. Don't-build list (from the freeze, restated for engineers)

No notification bell/inbox/badges · no fifth nav item, ever · no Approve button (publish/schedule IS approval) · no "+ New concept" · no progress percentages on unknown durations · no zeros for unknowns · no scores/confidence numbers in UI · no timeline editor · no template/connector marketplaces · no KPI config · no global autonomous mode toggle · no fake social proof · no emoji anywhere in product UI.
